

1 OVERVIEW

Synergy's Supported Solutions List (SSL) details supported CSIP-Aus software clients and hardware solutions and the compatibility between those solutions. Synergy will move to align to the national listing approach when this becomes available.

This list provides information on the capabilities of individual assets. In scenarios where multiple assets are installed (including retrofit of AC-coupled battery inverters to a site with existing PV inverter/s), Synergy's DER Functionality Requirements stipulate that the solution must achieve whole-of-site compliance.

The equipment retailer and installer is responsible for ensuring all assets onsite:

- are included on the Supported Solutions List, or able to be managed via a device on the supported solutions list
- are installed in a configuration that meets whole-of-site compliance requirements.

Refer to Synergy DER Functionality Requirements and FAQs for further information.

Notes regarding listing categories:

- For equipment retailers and installers that are seeking for devices and solutions to be utilised in a relevant Synergy Virtual Power Plant (VPP) product, or if these capabilities are a requirement of Western Power or a State or Federal program, the solution will need to be listed under DER – Storage.
- For all other installs where inclusion on the Supported Solutions List is a requirement, the solution will need to be listed under DER – Generator.
- For information on installation commissioning requirements and processes (including support for multi-inverter site configuration), installers should consult technology providers' documentation.
- A  against a client solution in a provisional column, indicates that the solution is 'activation ready', allowing customers to be activated in Synergy's VPP products.

2 HARDWARE AND CLIENT LIST

This table includes a list for all hardware OEMs and client solutions that have met Synergy's requirements for listing under any category.
